EFFECT OF WATER ON ADHESION OF BINDERS
TO SOLIDS. Pt. 2 of Boundary Surface Processes in
Water-Bituminous Binder Systems and their Importance
in Construction Practice. [1960] 34p. (23 figs. omitted)
8 refs.

Order from SLA mi\$3.00, ph\$6.30 61-10208

Trans. of Bitumen, Teere, Asphalte, Peche [und
Verwandte Stoffe] (West Germany) 1955, v. 6 [no. 1]
p. 12-20.

The process of rupture of the closed binder film upon
immersion in water has been observed under the
microscope. First water penetrates through the closed
binder film to the solid body, where it collects in the
form of minute bubblets. In some binders, the thinner
film over such a bubblet then ruptures, thus giving the
water direct access to the solid. Then only is there
visible binder displacement (pushing aside), to a
greater or lesser extent depending on the binder.
(Materials, TT, v. 5, no. 5) (over)

61-10208

1. Bituminous coatings--
Adhesion
 2. Adhesion--Analysis
- I. Wilhelmi, R.
 - II. Schulze, K.
 - III. Title: Boundary...
 - IV. Title: Bituminous...

Office of Technical Services

Binders that are greatly displaced (pushed aside) need not however manifest the poorest adhesion. Binders were tested in which adhesion vanished completely, i.e. which were easily detachable and where comparatively large bubblets were formed between binder coating and the solid body, but where the film of binder would not rupture and withdraw from the solid surface even after very prolonged immersion. DESCRIPTORS: *Complex compounds, Benzenes,
Chromium catalysts, Aluminum compounds, Chlo-
rides, Chemical reactions.

During the reaction of aluminum triethyl with chromyl
chloride in absolute benzene, very finely divided
suspensions of low-valency chromium compounds were
formed in a mixture with aluminum-organic com-
pounds. When butadiene is added to such a suspension,
with vigorous stirring and at 40°C and normal pres-
sure, a mixture of 40% trans, trans, cis-cyclo-
dodecatriene-(1, 5, 9) (Fp-18°C) and 60% all-trans-
(Chemistry--Organic, TT, v. 8, no. 6) (over)

Office of Technical Services

cyclododecatriene-(1, 5, 9) (Fp+34°C) is formed. The primary step of this cyclododecatriene synthesis consists of the formation of a π -electron complex of three butadiene molecules with the transition metal atom of the catalyst. In this complex, the three new C-C bonds are formed. The cyclododecatriene detaches itself subsequently from the chromium atom so that new butadiene molecules may approach. A similar but stable π -electron complex was obtained with the chromium atom of our cyclization catalyst. Six butene-(2) molecules interacted with each chromium atom of the cyclization catalyst, so that two aromatic systems were formed, which, in statu nascendi, led to the stable aromatic complex.
